Introduction

The goal of this project is to develop a prototype that not only assists but also motivates patients to achieve their weight loss goals effectively. We will first start by analysing stories of 50 patients who have successfully lost weight ([Personas Sheet](#)), which will serve as our main source of information thus being able to determine our application requirements and design decisions.

We will first start by exploring different aspects of UX design, focusing on intuitive navigation and clear information presentation as well as exploring the different prototyping methods including including rapid, low-fidelity, and high-fidelity techniques and the different tools available.

Throughout the project, user feedback will be essential and will be prioritised by integrating it from the initial wireframe stages to the final prototype. This feedback will be the foundation for the development of our app, Weightly, from its conceptual inception to the final prototype.

Links to Documents/Videos

[User Test Feedback Video Link](#)

[Final Prototype Video Demonstration Link](#)

[Axure File](#)

Real-life Cases Personas

In order to be able to determine what our app should consist of, we need to first understand what users usually look for in an app. In this respect, 50 real life cases scenarios were read and their data entered into a [personas sheet](#). Each story has been assigned one of three categories: Health Persona, Postpartum Persona and Special occasion Persona. From this data, it was possible to identify common requests and common interests that should be incorporated in our prototype.

With this date, three fictitious stories, one for each category have been drafted, including the requirements for each persona that would be implemented and featured in our app.

Category 1: Health Persona

Lara, at 34, lives a life packed with ambition and adventure. She is constantly juggling between her demanding full-time job, pursuing a part-time degree, and diving into the depths with her freediving passion, all while keeping up with swimming and intense strength training sessions. Her goal is to be the best version of herself and invest in her health so that she can live an independent lifestyle when she's older. Lara's mission is to shed the excess fat to unveil the muscle beneath.

Goals	Needs	Pain Points
Maintain healthy eating habits	Due to the limited free time, access to healthy recipes is a must	Gets distracted easily, needs apps that are simple and straight to the point
Be independent when old	Visual representation of progress	
Maintain a regular exercise schedule	Macros tracking	

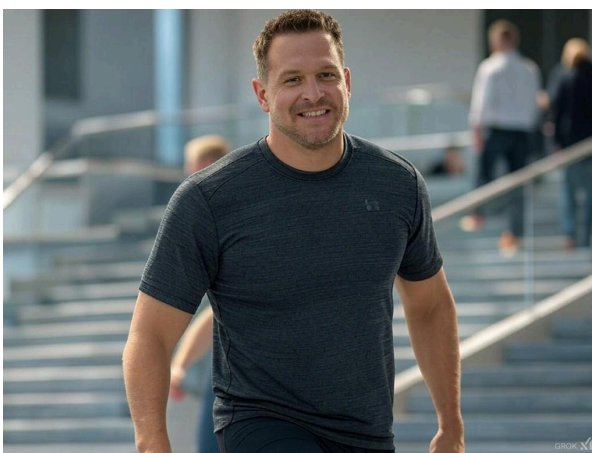

Category 2: Postpartum Persona:

Charlene, a first time mom at 31, embraced motherhood but like many others, struggled with her postpartum body. She started with some light home yoga during her baby Pippa's naps and took short walks with her in a stroller whenever she had enough energy to do so. Her friend suggested Charlene does a "Mommy and Me" fitness tutorial and find a community to share her struggles with . She is now on her fitness journey, gradually feeling stronger and more like herself, but better.

Goals	Needs	Pain Points
Eat healthier for herself and Pippa	Quick, easy, healthy meals	Easily thrown off track due to lack of sleep
Become strong and fit	Different workout options	Has a hard time remembering meals from previous days
Regain her life back	Community Feedback/discussions	Gives up if not encouraged by others to continue

Category 3: Special Occasion Persona:

Bobby, a 35-year-old lawyer, had always been active until his work schedule took over his life. With his wedding just months away, he (his wife) decided it was time to shed some pounds. He began by integrating short, high-intensity interval training (HIIT) sessions during his lunch breaks and opted for the stairs at work. A colleague introduced him to an online community focused on weight loss, where he shares his progress and gains motivation.

Goals	Needs	Pain Points
Lose weight for the wedding	Simple, low-calorie meal plans	Struggles with late-night snacking due to work stress
Improve overall health and stamina	Short, effective workout routines	Finds it challenging to maintain consistency with diet and exercise
Feel confident in a suit	Supportive community for accountability	Easily discouraged without regular encouragement from peers
Look good for his soon to be wife	Restaurant options for his clients' meetings	

Hence, from the above, we can deduce that the features requirements will include access to different recipes, healthy restaurant options, different workout options, option to track workouts, tracking daily macros, weight tracking, goal tracking, and a community,

Prototyping Functionality and User Testing

User Experience

User Experience (UX) is the comprehensive experience a person encounters when interacting with a product, system, or service. You can have the best app idea and the biggest budget; however, without the right UX, the app will be useless. In fact, the experience goes beyond aesthetics and also includes usability, functionality, and emotional impact (Nielsen and Norman, 2012). Some important key components include:

- **Ease of Use:** The app interface should be intuitive and straightforward to maintain user engagement. For our weight loss app, this means users should easily navigate and use features like meal logging, exercise tracking, or setting personal goals (Cooper et al., 2014).

For example, in the Fitbit app redesign, user testing identified navigation as a major issue, leading to a new tab-based menu and a 'Today' view, which, through iterative prototyping and user feedback, improved user retention by 15-20% (Fitbit Design Team, n.d.). This case study exemplifies the power of user-centered design in enhancing user experience (Fitbit Design Team, n.d.).

- **Perception of Value:** The app should make users feel that it is adding value to their life. This can be done by providing personal/tailored advice, providing educational content about nutrition and workouts, or perhaps showcasing progress in a fun, engaging way (Tractinsky et al., 2000).
- **Accessibility:** Ideally, app should also be usable and accessible to provide ease of accessibility through compatibility with assistive technologies such as screen readers, offer a color blind mode, or even designing for different device capabilities (Henry, 2007).
- **Overall Satisfaction:** A well-designed UX in a weight loss app should leave users feeling motivated to keep going and supported (Hassenzahl, 2001).

Important aspects of UX Design

1. Intuitive Navigation

Menus and layout should be clear, uncluttered, easy to navigate through and should also have a consistent design throughout the entire application for better interaction (Norman, 2013).

2. Clear Information Presentation

A great way to motivate users is to make use of charts and graphs for tracking their current progress and data should be presented in a simple, clear manner (Lidwell et al., 2010).

3. Motivation through User Interaction Design

Elements like achievement for having different levels can enhance user engagement (Zichermann and Cunningham, 2011). For example, a good way to represent this would be by awarding badges for milestones reached. Social media has a major effect on users, hence social support through features like community forums or shared challenges can be vital for motivation (Bandura, 1986). Another great way to encourage users would be through feedback or encouragement which can aid in building emotional connections (Fogg, 2003).

4. User Research and Testing:

Creating user personas to tailor the app to real user needs is essential to be able to determine which features need to be included and which may be useless (Pruitt and Adlin, 2006). Continuous feedback and testing is also an essential part of having a successful app, thus ensuring the app is refined and updated to the user's needs.

5. Adaptive Design:

Customising content and interaction based on user data or preferences (Adomavicius and Tuzhilin, 2005) is another important aspect of UX Design.

By combining the above, a weight loss app can help users achieve their targets while also making the process enjoyable and engaging, potentially leading to better retention and success rates.

Prototyping

Prototyping is a process where designers can test ideas and features before going into full production, thus reducing costs while making sure the final version meets the users' needs. There are 3 types of prototyping; Rapid, low-fidelity and high-fidelity prototypes:

1. Rapid Prototyping:

Rapid prototyping, as the name itself suggests, is a prototype style which prioritises efficiency by allowing designers to build simple prototypes aimed to collect feedback from users, thus allowing the developers to make continuous improvements based on the feedback collected. This enables developers to explore multiple concepts without wasting too much time on too many details, making this type of prototype idea where time is limited.

Rapid prototyping also allows developers to experiment and explore different ideas without having to invest further. If an idea is not liked by users, it can be scrapped without the fear of having lost too much time or money on one idea alone. It can also offer multiple solutions to one problem, which can lead to innovative features or user experiences (Kelley, 2001). This approach also lowers costs as flaws can be detected at an early stage, thus significantly reducing costs associated with later-stage development (Lichter et al., 1993).

While rapid prototyping is great, it comes with its disadvantages. Focusing on speed can sometimes lead to oversights in the design itself. If the feedback is being provided by people who do not have a clear vision, it might impact the final design of the project (Beaudouin-Lafon and Mackay, 2000).

2. Low-Fidelity Prototyping:

Low-fidelity prototyping involves creating simple representations of the product such as sketches, paper prototypes, or basic digital wireframes. This type of prototype focuses on basic layouts, user flows, and core functionalities rather than on aesthetics and detailed interactions themselves (Krug, 2010).

They allow developers to test concepts without wasting time on visuals, hence is beneficial in the early stages of the design where the emphasis is on functionality and structure rather than on how the app will look (Snyder, 2003).

Since low-fidelity prototypes require minimal resources to create, they are an economical choice for initial design phases. This allows for testing multiple ideas without significant investment, saving both time and money (Beaudouin-Lafon & Mackay, 2000). This approach makes it easier to get feedback on what truly matters, i.e. usability and structure of the app, without being distracted by aesthetic elements (Krug, 2010).

As with Rapid Prototyping, Low-Fidelity Prototyping also comes with its own disadvantages. Given their simplicity, low-fidelity prototypes might not convey the full user experience and could potentially affect users' perception of interaction in the final product (Rettig, 1994). This also provides limited feedback as the prototype might not portray the full interactions and animations. Something to also keep in mind is that stakeholders might not be aware of the type of prototype, leading to miscommunication and misunderstandings that the final app will not reach their expectations (Walker et al., 2002).

3. High-Fidelity Prototyping:

High-fidelity prototyping involves creating prototypes that resemble the final product in functionality and in appearance as much as possible (Cooper et al., 2007).

In app development, high-fidelity prototypes are used to test interactions and see the visual design, providing a near-final user experience (Saffer, 2010). It allows users to test navigation, interactions, animations and allows developers to see how a user would interact with the app and whether it is straightforward or not. This also closes the gap between the prototype and the final product itself, reducing the back and forth feedback in the later stages of development (Saffer, 2010).

Having such a detailed prototype means that the prototype itself is more elaborate and more time-consuming to develop, which might slow down the overall development process (Walker et al., 2002). Another issue that comes with such highly detailed prototypes is that people who are not involved in the process might be under the misconception that the project is complete or near completion, potentially leading to complacency or even underestimation of the remaining work (Rettig, 1994). It is also important to note that such high-fidelity prototypes also require additional resources such as software and skills which can be more expensive than the other low-fidelity options (Beaudouin-Lafon & Mackay, 2000).

Standard Tools for Prototyping

Several tools stand out due to their effectiveness and popularity in the design community:

- **InVision:** Excellent for creating interactive, high-fidelity prototypes that simulate the final product's feel. It's particularly good for team collaboration through its real-time feedback capabilities (InVision, n.d.).
- **Balsamiq:** Specializes in low-fidelity wireframing, providing a quick and easy way to sketch out ideas. Its hand-drawn style helps keep focus on functionality rather than aesthetics (Balsamiq, n.d.).
- **Axure:** Offers both low and high-fidelity prototyping with strong support for creating complex interactions, useful for detailed user flow and conditional logic (Axure, n.d.).
- **Figma:** A versatile tool supporting all levels of fidelity with real-time collaboration features. Figma is noted for its ease of use in creating responsive designs and prototypes (Figma, n.d.).

After examining and considering the above options, Axure was selected as the main Tool for this project. Axure (free trial) has been successfully downloaded on 22nd February 2025.

End-User Testing Requirements

To ensure the effectiveness of the weight loss application, it's important to set clear objectives for user testing. These goals should include verifying the accuracy of [user personas](#), assessing ease of use, measuring user engagement, and confirming that the motivational aspects of the app are effective. According to Krug (2010), specifying these goals helps guide the testing process, making it more efficient and targeted towards real user needs.

- **Selecting the right testing methods** is crucial for obtaining a comprehensive understanding of how users interact with the app. Qualitative methods like interviews and focus groups provided deep insights into user emotions, motivations, and challenges (Pruitt and Adlin, 2006). Quantitative methods such as surveys, A/B testing, and analytics quantified user behaviors, satisfaction rates, and success metrics (Cooper et al., 2014). By employing both approaches, we achieved a balanced view of user experience.
- **A well-planned testing schedule** is essential for continuous improvement. Testing should be carried out at multiple stages - from early wireframes to prototypes after significant

updates and before the final release. This iterative approach, as discussed by Cooper et al. (2007), ensures that the app evolved with user feedback.

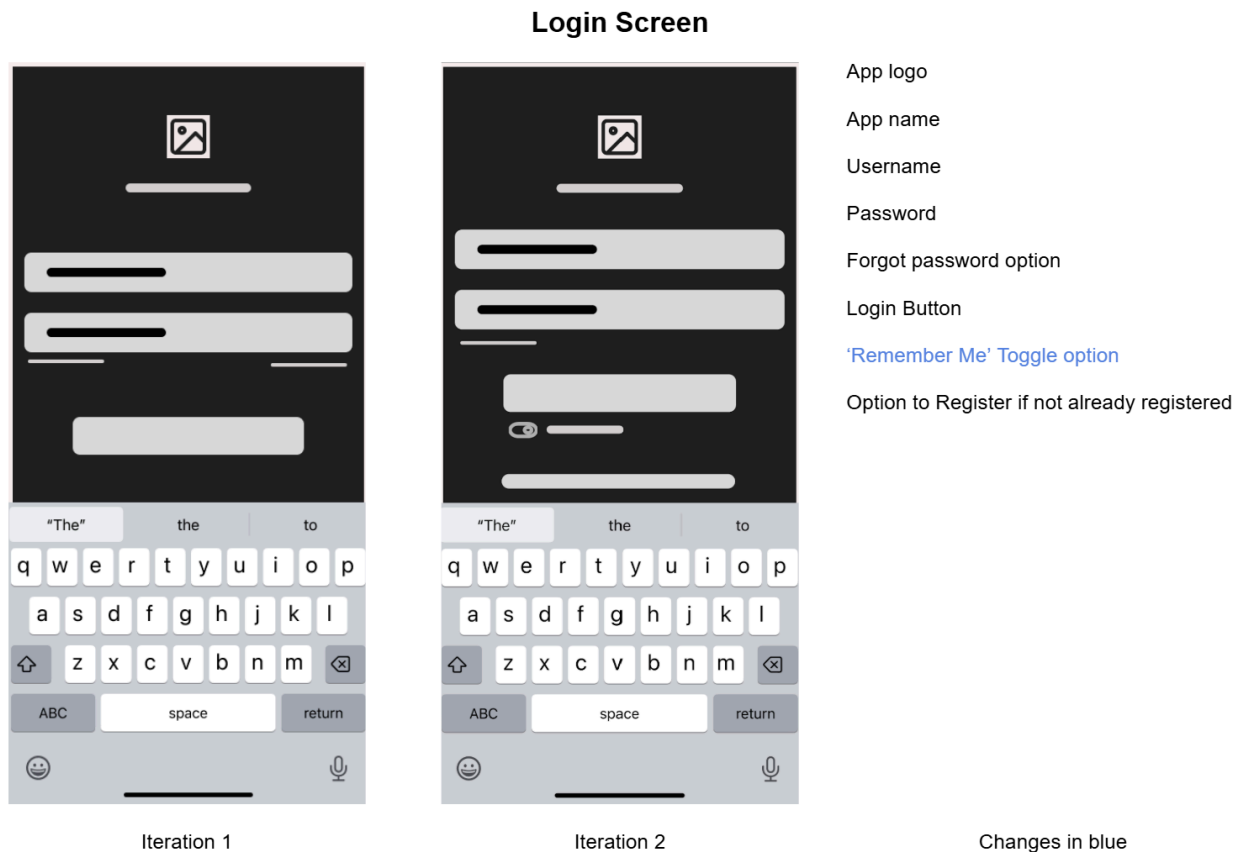

- **Feedback loop and documentation** are vital in creating a functional product. Feedback should be collected and any design changes made in response to these changes should be documented. This documentation is crucial for accountability, learning from past iterations, and ensuring continuous improvement (Cooper et al., 2014).

Wireframes & User Feedback

With all the planning and research done, the first 10 wireframes of version 1 of the Weightly App have been sent for user feedback to Mr Aleandro Cachia and the below feedback (in blue, in italics) was provided:

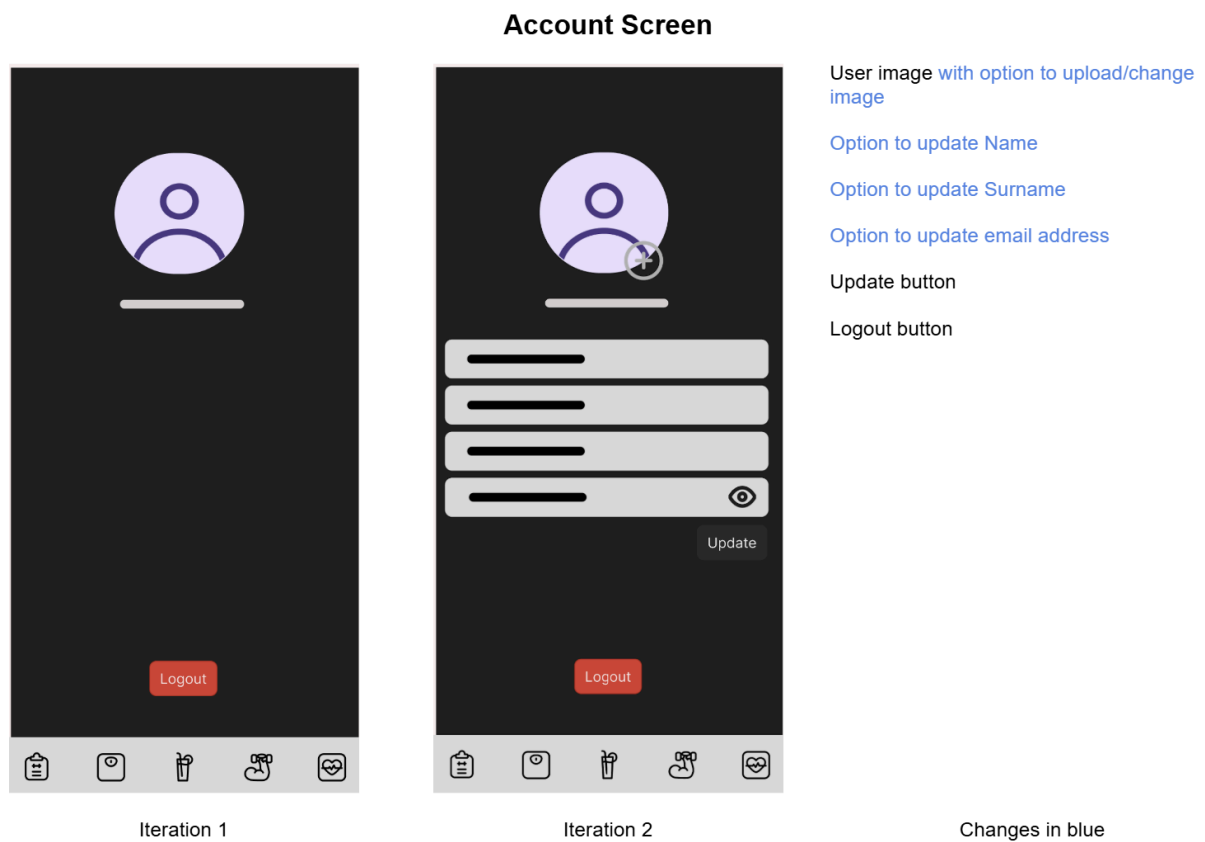

1. **Login Screen:** *It looks very neat and well designed, however it lacks the option to sign in with google or Facebook buttons. Passwords are also hidden on apps, hence the option to hide/show password should be removed.*

Feedback was duly noted; however, for this project, it will not be implemented. In the meantime, upon reviewing the login screen, a 'remember me' option has been added to Iteration 2.

2. **Dashboard screen:** *The user picture (top left corner) should also have an option to modify the user profile (name, surname, age, gender, etc).*

Name, Surname, Email address and Password, update and upload profile picture functions have been implemented on a new Account Page, upon clicking on the profile picture.

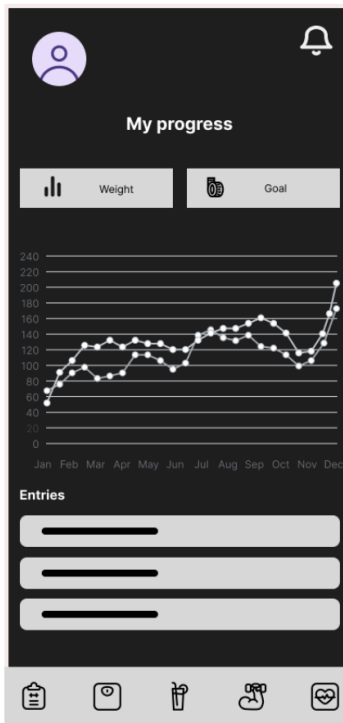

3. **Weight screen:** A Percentage view of how close the user is making progress can be included for easy viewing and better understanding for people who are not very comfortable with reading graphs.

Although a good suggestion, changing to percentage would not provide a visual representation of the progress hence the suggestion has not been implemented.

A sharing button to share progress to the community would be a good “reward” (psychologically speaking) for the user to increase motivation.

Feature has been implemented and wireframe updated.

Weight Screen

Iteration 1

Iteration 2

Changes in blue

- Users can update their current weight
- Users can update their current weight goal
- Visual graph to show weight fluctuation throughout the year
- List of weight update entries
- [Option to share progress with community](#)

- Recipes Screen:** *No sharing of recipes is available. It can be added so that users can have feedback on their newly made recipes. On the other hand, the macros option is a well thought of idea for implementation in this screen.*

The app was designed such that only the admins/owners can add approved recipes, not the users. However, users are able to share and ask questions in the community tab. Therefore, with this original thought process in mind, the suggestion has not been implemented.

- Workout Screen:** *The user cannot create his own workout routine.*

The feature is already implemented in the top right corner of the screen. It has been renamed from 'Log Workout' to 'Log Custom Workout' for clarity..

Workouts Screen

Iteration 1

Iteration 2

Changes in blue

Users can log custom exercise (renamed to 'Log Custom Exercise')

Users can search for workouts by body part or video name if they know it

Can filter by type of workout and duration, trainer

Can sort by date added or duration

Visual representation of video and name of video

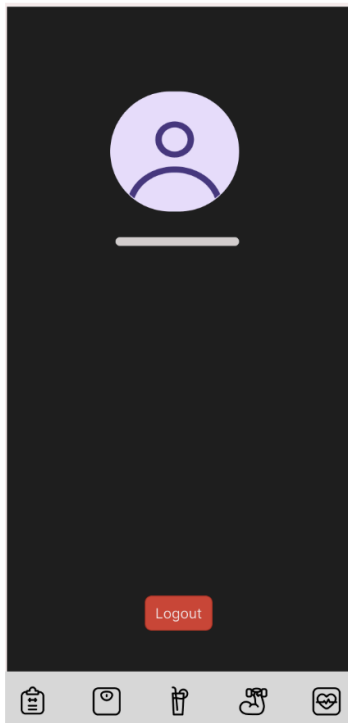

6. **Community Screen:** Seems well structured but no option to view your followers and who is following you.

The community tab was designed as a forum-style platform, where you follow discussions rather than individual users. To view the following conversations, the filter can be used.

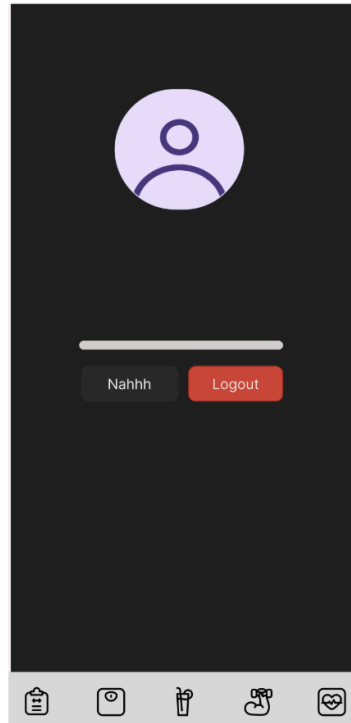

7. **Logout Screen:** An engagement phrase written on screen while logging out might encourage the user to stay connected and use the app.

A new screen with 'Are you sure you want to log out' has been implemented.

Log Out Screen

Iteration 1

Iteration 2

User image

Message asking user if they are sure they want to leave

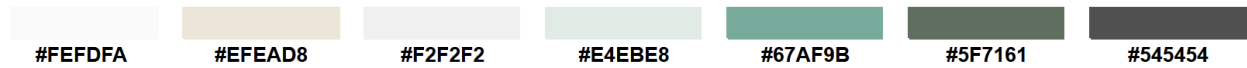

Button for no

Button to log out, which redirects to the Login page

Changes in blue

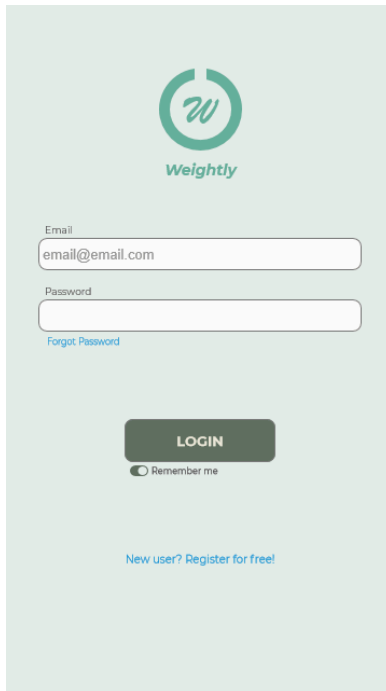

The Prototype

With the wireframes updated with the provided feedback, it is time to now start creating our prototype. For this project, and based on the research above, Axure will be used. As indicated in the above sections, UX is a vital for the success of our prototype, hence the below clean, soft and simple colour palette has been selected:

Community New Post Screen. The screen features a header with a user profile icon and a notification bell. Below the header is a section titled "Ask the community!" with a text input field labeled "Write post here" and a "POST" button. A "DELETE" button is also visible. The bottom navigation bar includes icons for home, search, post, and community.

Menu: My Weight Progress Screen

Share My Progress Screen

Share My Progress Screen. The screen displays a post from a user named "user52" 2 hours ago. The post title is "Plateau Struggle, need advice!". The post content describes a user's fitness journey and a plateau. Below the post, there is a "Comments" section with a comment from "user123" 2 hours ago. The bottom navigation bar includes icons for home, search, post, and community.

Post:

Title: Plateau Struggle, need advice!

Content: "I've been on my fitness journey for about six months now, and I wanted to share my progress and seek some advice. I've managed to lose 25 pounds, which feels amazing, but I've hit a plateau. I started with home workouts, feeling too shy for the gym, but now I'm comfortable in a local one, mixing strength training with HIIT. However, my weight loss has stalled, and I'm not sure what to do next. I'm looking for advice on breaking through this plateau. Should I adjust my diet? I eat pretty clean, but maybe there's more I can do. Or should I change my workout routine? I've heard about the benefits of compound movements or trying a new sport. Also, I sometimes struggle with motivation or doubt my progress. How do you all push through those days when you just don't feel like working out?"

Comments:

Comment: user123 2 hours ago: You can do it, don't give up!

Prototype Feedback

An [online meeting](#) was held with Mr Aleandro Cachia on the 9th of February to test how a user would go about using the app to test whether it is intuitive as intended, whether the information is provided clearly, and whether the user is motivated to keep using it.

The below have been noted throughout the session:

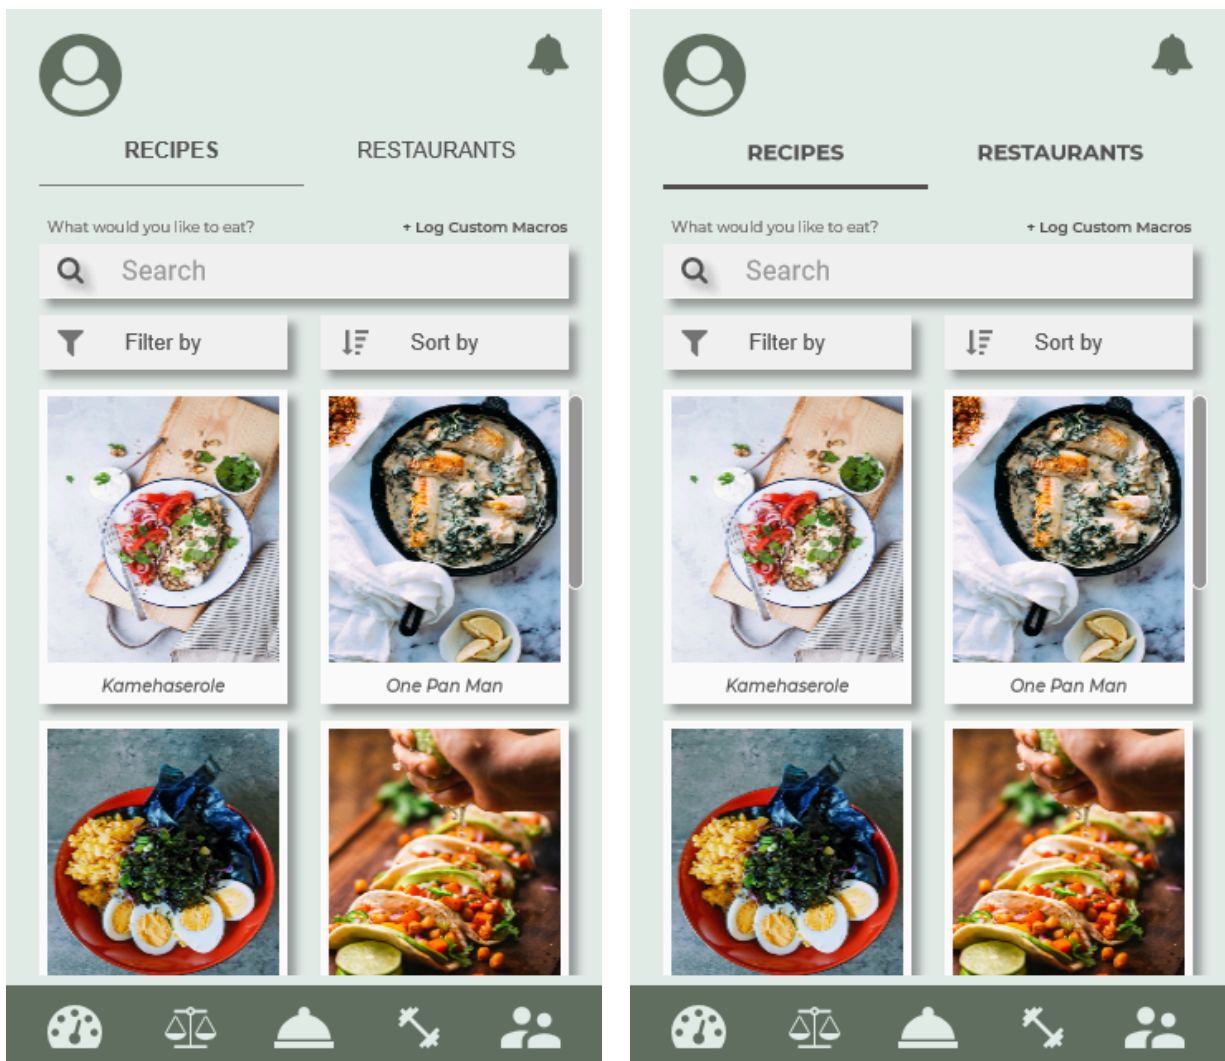

Screen	Comments	Action
Login Screen	n/a	n/a
Account Screen	n/a	n/a
Log Out Screen	n/a	n/a
Menu: Dashboard Screen	n/a	n/a
Menu: Recipes Screen	n/a	n/a
Menu: Restaurant Screen	Restaurant Section was missed completely	To make it more prominent so user do not miss this feature
View Recipe Screen	n/a	n/a
Log Macros Screen	n/a	n/a
Menu: Workout Screen	n/a	n/a
View Workout Screen	n/a	n/a
Menu: Community Screen	n/a	n/a
View Community Post Screen	User noted that, once a comment has been liked or disliked, it doesn't allow undoing and both buttons can be pressed simultaneously, which should be the case	To fix
Community New Post Screen	n/a	n/a
Menu: My Weight Progress Screen	n/a	n/a
Share My Progress Screen	n/a	n/a

Comments overall were very positive and user seemed to be able to use the app without any difficulties. However, some key areas for improvement have been identified, particularly in enhancing the visibility of the Restaurant Section, which was completely missed by the user, and fixing the functionality related to community post interactions.

Post Test Updates

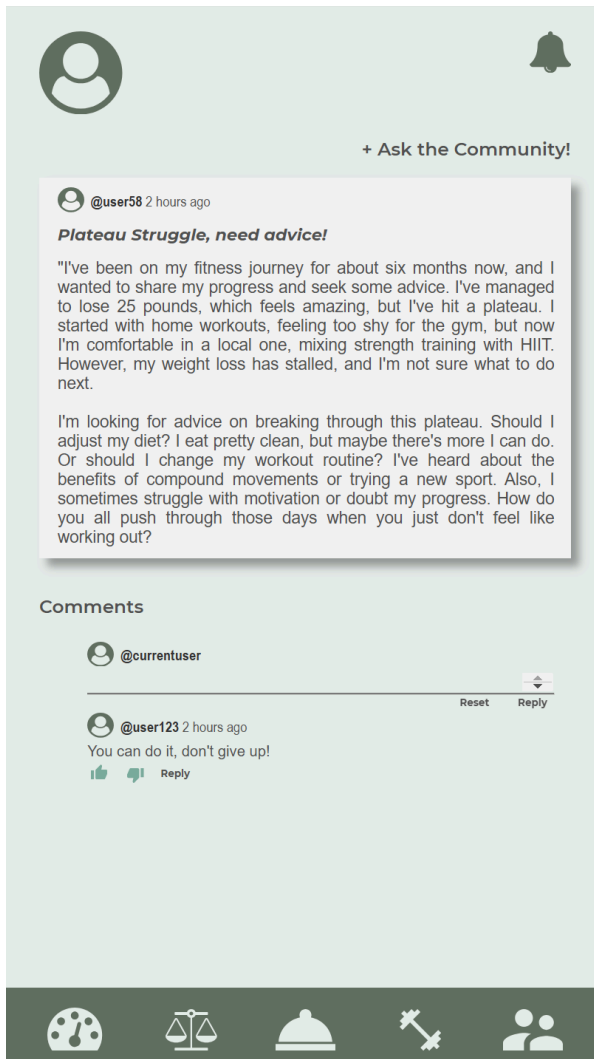

After receiving feedback from Mr Cachia through the online test session, the suggestions received were taken into consideration and implemented as illustrated below: .

Recipes Screen

The font has been set to bold, and the line indicating which tab is currently visible has been made more prominent to better catch the user's attention.

View Community Post Screen

Like and Unlike buttons updated so that they cannot be pressed simultaneously plus added the option to undo.

Post Test Survey

A 10 question survey taken from the UsabilityGeek website (Thomas, 2015) has also been sent to user to evaluate his experience using the System Usability Scale (SUS). Participant was asked to rate each question on a scale of 1 to 5, where 5 indicates strong agreement with the statement, and 1 indicates strong disagreement. The results were as follows:

Column 1	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
I think that I would like to use this system frequently.	☒	☐	☐	☐	☐
I found the system unnecessarily complex.	☐	☐	☐	☐	☒
I thought the system was easy to use	☒	☐	☐	☐	☐
I think that I would need the support of a technical person to be able to use this system	☐	☐	☐	☐	☒
I found the various functions in this system were well integrated	☒	☐	☐	☐	☐
I thought there was too much inconsistency in this system	☐	☐	☐	☐	☒
I would imagine that most people would learn to use this system very quickly	☒	☐	☐	☐	☐
I found the system very cumbersome to use	☐	☐	☐	☐	☒
I felt very confident using the system.	☒	☐	☐	☐	☐
I needed to learn a lot of things before I could get going with this system	☐	☐	☐	☐	☒

Based on the above feedback provided by Mr Cachia, the user expressed a strong inclination towards liking the system and suggested he would be interested in using it frequently, as indicated by their selection of "Strongly Agree" for the statement "I think that I would like to use this system frequently." They also found the system easy to use, with functions well integrated, and felt confident in their ability to use it. However, the user did not find the system complex or cumbersome, strongly disagreeing with statements suggesting complexity or cumbersome use. They did not feel the need for technical support to use the system, nor did they perceive it as inconsistent. The user also believed that most people would learn to use the system quickly, suggesting a positive reception of the system's usability and design.

This feedback indicates a successful alignment with the user experience goals set out in the original project plan.

Evaluation Report

The primary purpose of this project is to create a mobile application prototype, commissioned by the country's national health service, to assist patients in their weight loss efforts and determination.

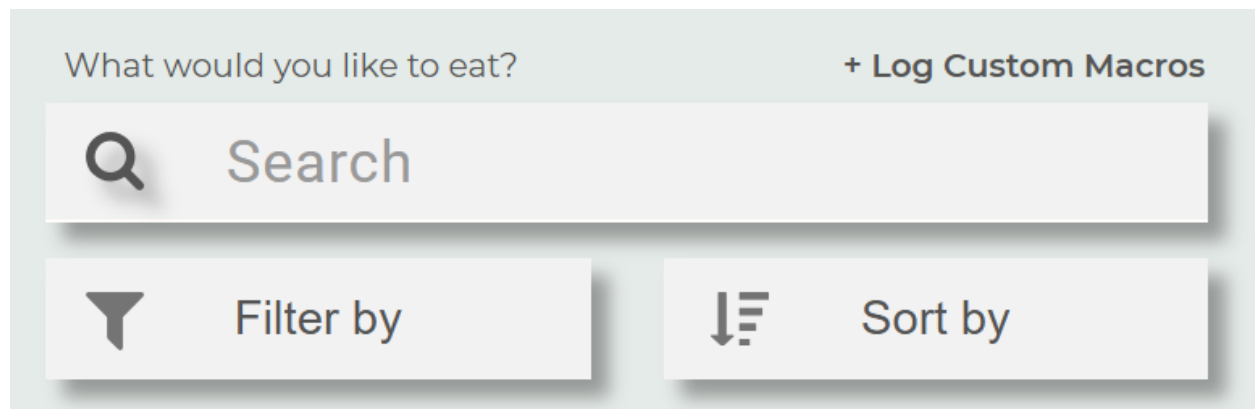

The main goal of the project is to motivate users through community interactions, progress tracking, and providing access to healthy recipes and restaurants, all which have been successfully implemented while keeping the app simple and intuitive so as not to overwhelm the users. These features align with the initial goal of assisting and motivating weight loss in our users.

User feedback was gathered through different stages of the project via online meetings, which have been recorded, surveys (specifically the SUS), iterative wireframe reviews and prototype testing, ensuring continuous refinement. This approach provided more insights on how users who have not been involved in the development perceive and use the app.

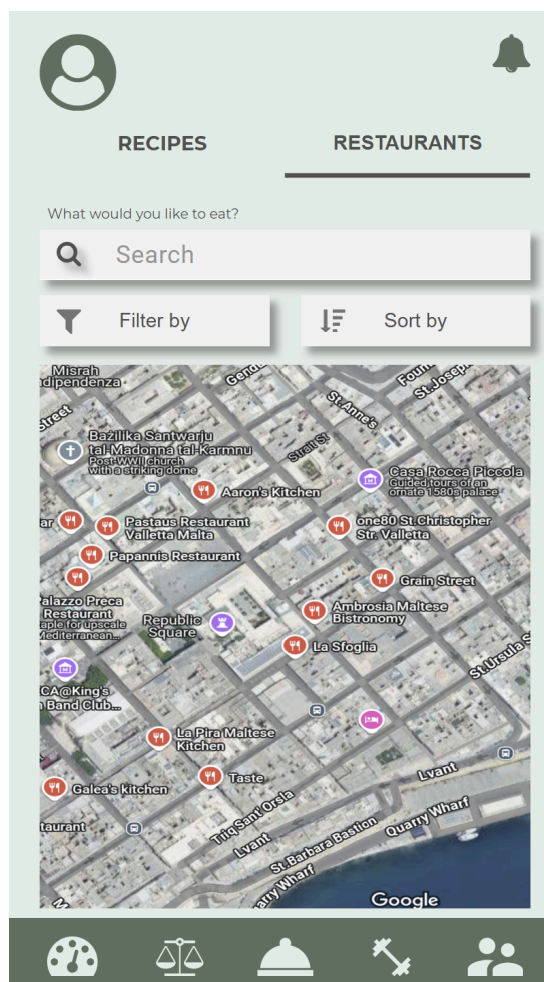

As we have explored, UX is a vital aspect for a successful app. Hence UX components like ease of use, value perception, accessibility, and satisfaction, were carefully incorporated into the prototype by using a clean, simple and soft colour scheme/palette. However, UX goes beyond visual appearance and needs to be functional and intuitive. In fact, during user testing, the initial design aspects of the visibility of the restaurant section on the prototype was not immediately intuitive. Having access to healthy restaurants was one of the main objectives, hence the issue was promptly addressed by making the section more prominent thus ensuring future users do not miss this important feature, potentially leading to them to not use the app.

Issues with the like/dislike functionality on community posts were also pointed out during prototype testing and corrected, further confirming the importance of user testing and feedback to adapt the app to user needs.

While the final prototype is functional and provides a very good idea of the final product, some areas have not been enhanced to show the fully functional working prototype hence the user was not able to test these functions. For example, the 'Filter by' and 'Sort by' options were not interactive. This was done to save time, assuming that user would know how to use a filter and a sorting option:

Another aspect that would have given a better representation of the working product would have been adding a fully interactive google map to the restaurant selection screen. Again, this was done assuming the user would know how to use an interactive google map, hence it was not made interactive for time-saving purposes:

The project excelled in user engagement through feedback loops, which was crucial for UX-centric applications, while changes such as updating the workout screen to clarify custom workout options showed agility in development. However, having said that, all user-suggested changes have been implemented, such as social media logins, potentially impacting user satisfaction or ease of adoption. Any changes implemented, as well as those which have not been implemented have been documented accordingly.

The final prototype overall meets the intended purposes and shows a strong effort in aligning with the original plan through a focus on user experience and feedback integration. However, given that only one user tested the processes, there might be areas where the app could be refined further to better match user expectations and project efficiency. Feedback is essential hence in an ideal world, more feedback from different users would have been gathered and analysed, thus having a more chance of having a successful app which caters for all users and not just one.

Final Prototype

Following feedback and tests done, the final prototype has been completed. A video demonstration of how it works is available [via this link](#)

Conclusion

Reflecting on the development and prototyping of the Weightly app, this project has been a fun learning journey, especially as my first comprehensive venture into designing a mobile and web application aimed at aiding weight loss. It is safe to say that it has clearly highlighted the importance of thorough planning and execution, as well as the ability to stay flexible and adapt as challenges arise.

One of the primary lessons learned was the critical nature of user experience (UX) in app development. The emphasis on UX from the outset, through analysing user personas and feedback, ensured that the app's features like meal logging, exercise tracking, and community interaction were not only functional but also engaging and motivating for users. However, the project also revealed areas for improvement, particularly in how feedback loops were managed. For instance, the initial oversight of the restaurant section in the prototype highlighted the necessity of ensuring that all features are equally discoverable and intuitive to users.

The use of prototyping tools like Axure allowed for rapid iterations, but balancing between rapid prototyping for quick feedback and high-fidelity prototyping for detailed user interaction was challenging. This balance is crucial to ensure that while core functionalities are developed efficiently, the user experience does not suffer due to rushed designs.

Finding online resources and documentation was relatively easy. There are quite a number of tutorials, documentation, papers, journals etc. available.

Communication and documentation emerged as vital elements during this project. The discrepancies noted between wireframes and user feedback in some instances suggest there is room for more rigorous documentation practices to keep all team members aligned with the project's evolving needs and user expectations.

Overall, creating the Weightly app was not only engaging but also educational, deepening my understanding of UX design, user feedback integration, and agile development methodologies. Although not every suggested feature or feedback was incorporated into the final prototype, I am pleased with the outcome. The clean, user-friendly interface achieved through this project sets a solid foundation for future enhancements, reflecting the essence of adaptable software development where continuous improvement is always on the horizon.

Users will be redirected to the next screen where they can log their own custom macros

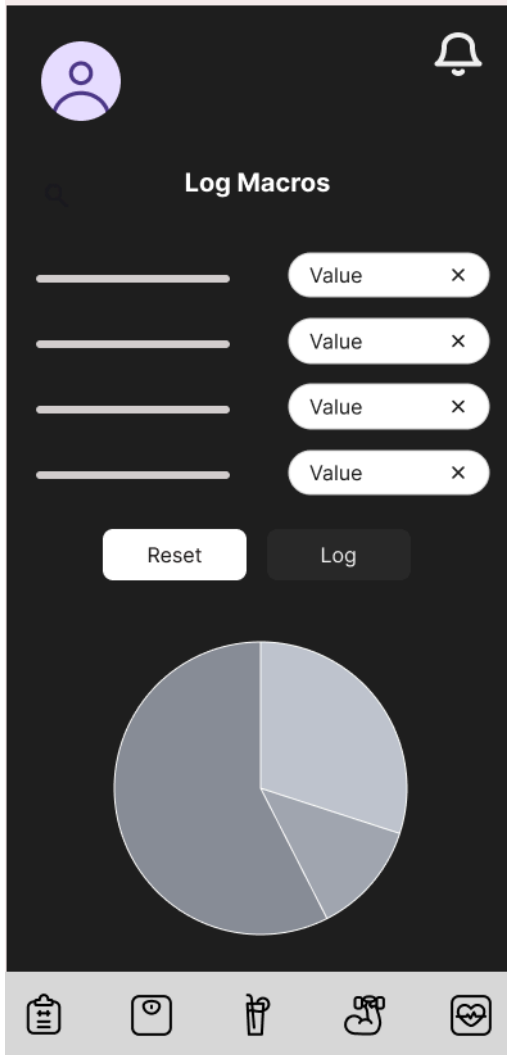

Users can search specific foods

Users can filter foods by calories range, gluten free, dairy free, vegan, and vegetarian

Users can sort by date added and calories

Visual of recipe and title of recipe with calories

Log Macros Screen

The image shows a mobile app screen titled "Log Macros". At the top left is a purple circular profile icon, and at the top right is a white bell notification icon. Below the title, there are four horizontal input fields for logging macro values. To the right of each input field is a white pill-shaped button with the text "Value" and a small "x" icon for clearing the input. Below these input fields are two buttons: a white "Reset" button and a dark grey "Log" button. At the bottom of the screen is a large pie chart with three segments of different shades of grey, representing the distribution of the logged macros. A bottom navigation bar contains five icons: a clipboard, a scale, a glass of water, a dumbbell, and a heart with a pulse line.

Users can log their own custom macros such as fats, proteins, carbs etc.

Button to reset current input or Log current input

Visual representation of current macros distribution

Workouts Screen

Users can log custom exercise

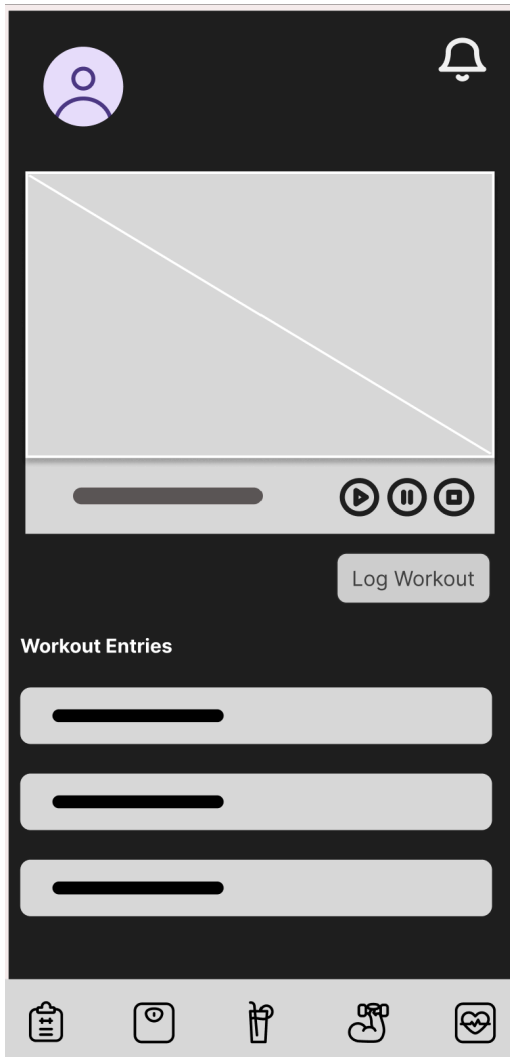

Users can search for workouts by body part or video name if they know it

Can filter by type of workout and duration, trainer

Can sort by date added or duration

Visual representation of video and name of video

Log Macros Screen

Iteration 1 of the Log Macros screen. The interface features a dark background with a purple user profile icon and a bell icon at the top. Below the title "Log Macros", there are four horizontal input fields, each followed by a "Value" label and a close button (X). At the bottom of the input section are two buttons: "Reset" and "Log". Below these buttons is a pie chart with three segments: a large dark grey segment, a medium light grey segment, and a small medium grey segment. At the very bottom is a navigation bar with five icons: a clipboard, a camera, a glass, a hand, and a heart.

Iteration 1

Iteration 2 of the Log Macros screen. This iteration is identical to Iteration 1, showing the same layout of input fields, buttons, and a pie chart representing the current macros distribution.

Iteration 2

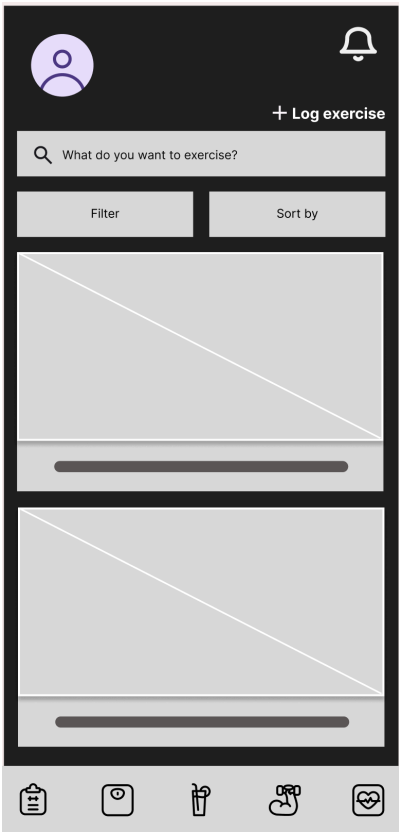

Users can log their own custom macros such as fats, proteins, carbs etc.
